IEC 61000-4-11:2004)

(Note: The EN 55022 emission measurement results are deemed satisfactory evidence of compliance with AS/NZS CISPR 22 regulations)

The device described above was tested by AUDIX Technology Corporation to determine the maximum emission levels emanating from the device, its ensured severity levels, and performance criterion. This test report contains the measurement results, and AUDIX Technology Corporation assumes full responsibility for the accuracy and completeness of these measurements. Also, this report shows that the EUT is technically compliance with the requirements of EN 55022(CISPR 22 & AS/NZS CISPR 22) 、 EN 61000-3-2, -3 and EN 55024 standard.

This report applies to above tested sample only and shall not be reproduced in part without written approval of AUDIX Technology Corporation.

N/A is an abbreviation for Not Applicable.			

2.2. Description of Performance Criteria

2.2.1. Performance criterion A

During the test, when seen from the normal viewing distance, the EUT shall operate with no change beyond the manufacturer's specification, in flicker, colour, focus and jitter (except for the power frequency magnetic field test).

Power frequency magnetic field test

For CRT monitors, the following also applies:

The jitter shall be measured when the CRT monitor is immersed in a continuous magnetic field of 1 A/m (r.m.s.) at one of the power frequencies of 50 Hz or 60 Hz.

For displays with pixels having continuous luminance distributions only, jitter may be measured using a measuring microscope of at least 20 power. The movement is determined by visual alignment of the microscope cursor or comparator reticle with the extreme positions of the centroid or edge of a character or test object during the observation period.

For any display type, a special display-measuring device may be used. This device shall determine, on a scan-by-scan basis, the relative location of a character or test object. If a device is used that determines movement along the horizontal and vertical axes only, the extent of the jitter shall be defined as the square root of the sum of the squares of the maximum horizontal and vertical differences.

Observations shall extend for periods of at least 4 s. Measuring devices that sample scans shall accumulate a number of scans equivalent to at least 4 s of continuous observation.

The maximum jitter permitted is given by:

$$J \leq \frac{(C + 0,3) \times 2,5}{33,3}$$

where

J is the jitter (in mm);

C is the character height (in mm).

Alternatively, a field of 50 A/m may be applied, and a transparent graduated mask used to assess the jitter. In this case, the jitter shall not exceed 50 times the value in the above formula.

The EUT shall be tested in two positions, both perpendicular to the magnetic field.

2.2.2. Performance criterion B

Screen disturbances during the application of the test are permissible if they self-recover after removal of the external disturbance.

2.2.3. Performance criterion C

Failures during the test that cannot self-recover after removal of the external disturbance, but which can be recovered after the test to normal operation by reset or reboot are permissible.

3. GENERAL INFORMATION

3.1. Description of Device

Description	:	LCD Monitor
Model Number	:	(1)E2275SW** (2)215LM000** (“*” = alphameric or blank) The difference of above models are in sales marketing. The model E2275SWDA was tested in this report.
Brand	:	AOC
Applicant	:	Taiwan BOE Vision-electronic 7F, No.2, Rei Kung Road., Nei Hu, Taipei, Taiwan, ROC
Manufacturer	:	Taiwan BOE Vision-electronic 7F, No.2, Rei Kung Road., Nei Hu, Taipei, Taiwan, ROC
Factory	:	K Tronics (Suzhou) Technology Co., Ltd. No. 1700, Zhongshan North Road, Economic and Technological Development Zone, Wujiang District, Suzhou, Jiangsu Province, PRC
Max. Resolution	:	1920*1080/60Hz
D-Sub Cable	:	Shielded, Detachable, 1.5m Bonded two ferrite cores
AC Power Cord	:	Unshielded, Detachable, 1.5m (3C)
Date of Receipt of Sample	:	2015. 11. 09
Date of Test	:	2015. 11. 11 ~ 17

Remark 1:

The EUT is a LCD Monitor which input/output ports as follows:

Back View:

- (1) One AC Input Port
- (2) One DVI Port
- (3) One D-Sub Port
- (4) One Audio Port
- (5) One Earphone Port

Remark 2:

The EUT with the following test modes were pre-scanned.

Test Item	Input Port	Display, Resolution/Frequency
Conducted Disturbance & Radiated Disturbance	DVI	"H" Pattern, 1920*1080/60Hz
		"H" Pattern, 1280*1024/75Hz
		"H" Pattern, 640*480/60Hz
	D-Sub	"H" Pattern, 1920*1080/60Hz
H & V & EMS test	DVI	"H" Pattern, 1920*1080/60Hz

Finally, the under worse test modes were demonstrated compliance with the standards in the report.

Test Item	Input Port	Display, Resolution/Frequency
Conducted Disturbance	DVI	"H" Pattern, 1920*1080/60Hz
Radiated Disturbance	DVI	"H" Pattern, 1920*1080/60Hz

	1GHz~6GHz	±1.7dB

Remark : Uncertainty = $ku_c(y)$

4.4. Operating Condition of EUT

- 4.4.1. Set up the **LCD Monitor (EUT)** and simulator as shown on 4.2.
- 4.4.2. To turn on the power of all equipment.
- 4.4.3. The PC system read data from disk.
- 4.4.4. The PC system was running the self-test program “Hwin” by Windows 7 and sending “H” characters to the EUT via DVI input, the screen was filling with “H” pattern by EUT’s resolution.
- 4.4.5. The PC system was running the program “Windows Media Player” and sending sounds to Earphone.
- 4.4.6. The other peripheral devices were driven and operated in turn during all testing.

4.5. Test Procedure

The EUT was put on table which was above the ground by 80cm and power cord was connected to the AC mains through an Artificial Mains Network (A.M.N.). The other peripheral devices power cord connected to the power mains through a line impedance stabilization network (L.I.S.N.). This provided a 50 ohm coupling impedance for the measuring equipment. (Please refer to the block diagram of the test setup and photographs.)

Both sides of A.C. line were checked for maximum conducted interference. In order to find the maximum emission, the relative positions of equipment and all of the interface cables were changed according to EN 55022 Class B regulations during conducted emission measurement.

The bandwidth of the R&S Test Receiver ESCI was set at 9kHz.

The frequency range from 150kHz to 30MHz was pre-scanned with a peak detector.

The all final readings from test receiver were measured with Quasi-Peak detector and Average detector. (Remark : If the Average limit is met when using a Quasi-Peak detector, the Average detector is unnecessary)

4.6. Conducted Disturbance Measurement Results

PASSED. All emissions not reported are below too low against the prescribed limits.

The EUT with following the worst test mode was performed during this section testing and to read Q.P and Average value, and the test data are listed in next pages.

5. RADIATED DISTURBANCE MEASUREMENT

5.1. Test Equipment

The following test equipment was used during the radiated disturbance measurement:

5.1.1. For 30MHz-1000MHz Frequency (At No. 7 Open Area Test Site)

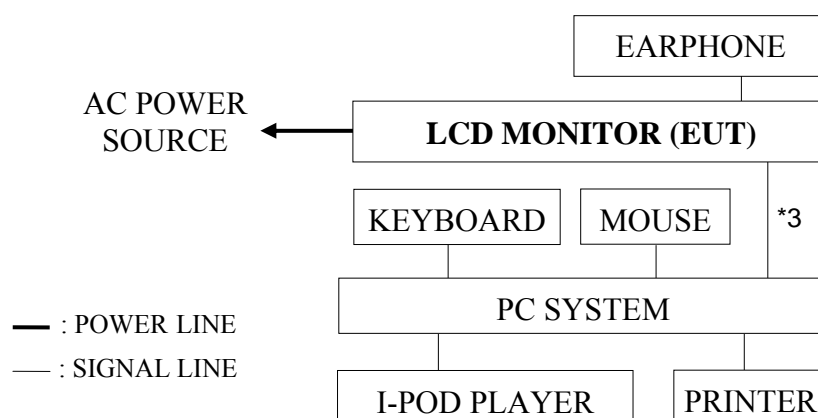

Item	Type	Manufacturer	Model No.	Serial No.	Cal. Due Date	Cal. Interval
1.	Spectrum Analyzer	Agilent	N9010A-507	MY48031090	2015. 10. 12	1 Year
2.	Test Receiver	R&S	ESCI	100557	2015. 01. 07	1 Year
3.	Amplifier	HP	8447D	2727A06154	N.C.R	N.C.R
4.	Bilog Antenna	ETC	MCTD 2786	BL13F03010	2015. 01. 26	1 Year

5.1.2. For Above 1GHz Frequency (At No.2 Semi-Anechoic Chamber)

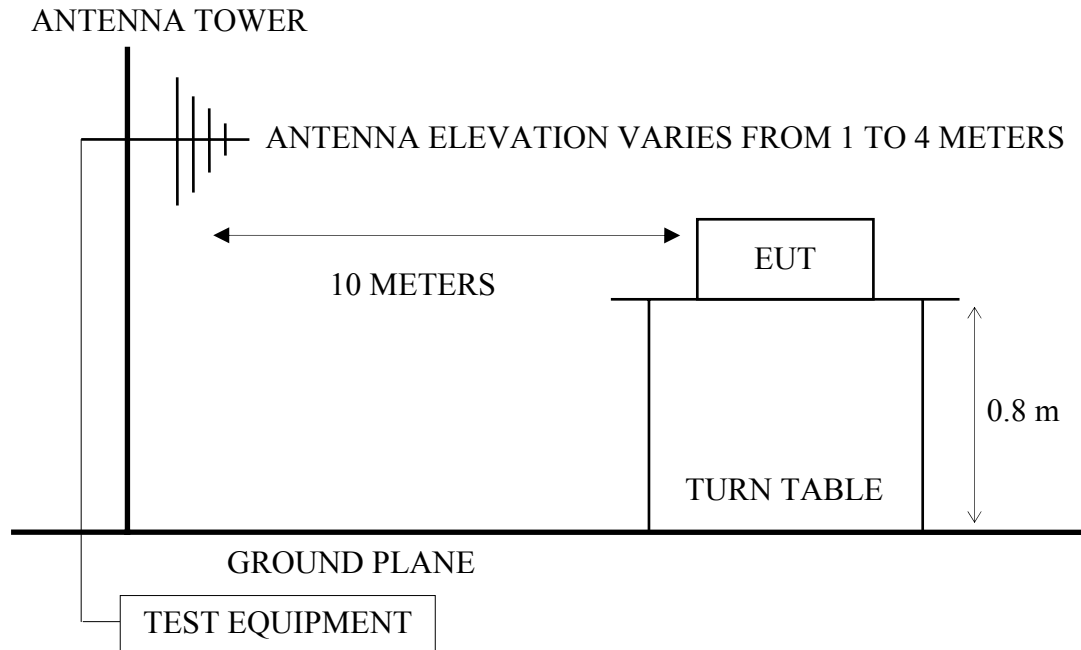

Item	Type	Manufacturer	Model No.	Serial No.	Cal. Date	Cal. Interval
1.	Spectrum Analyzer	Agilent	N9010A-526	MY48031076	2015. 09. 24	1 Year

5.2.2. Open Area Test Site (10m) Setup Diagram for 30-1000MHz

5.2.3. Semi-Anechoic Chamber (3m) Setup Diagram for above 1GHz

5.3. Limits for Radiated Disturbance

(EN 55022/ AS/NZS CISPR 22, Class B)

5.3.1. Limit below 1GHz

Frequency (MHz)	Distance (Meters)	Field Strengths Limits (dB μ V/m)
30 ~ 230	10	30
230 ~ 1000	10	37

- Notes:
- (1) The tighter limit applies at the edge between two frequency bands.
 - (2) Distance refers to the distance in meters between the measuring instrument antenna and the closed point of any part of the E.U.T.

5.3.2. Limit above 1GHz

Frequency (GHz)	Distance (Meters)	Average Limits (dB μ V/m)	Peak Limits (dB μ V/m)
1 ~ 3	3	50	70
3 ~ 6	3	54	74

- Note :
- (1) The lower limit applies at the transition frequency.
 - (2) Distance refers to the distance in meters between the measuring instrument antenna and the closed point of any part of the E.U.T.

5.4. Operating Condition of EUT

Same as conducted measurement which is listed in 4.4.
except the test set up replaced by section 5.2.

5.5. Test Procedure

5.5.1. For Frequency Range 30MHz-1000MHz, which measurement was at Open Area Test Site:

The EUT and its simulator were placed on a turn table which was 0.8 meter above ground. The turn table rotate 360 degrees to determine the position of the maximum emission level. EUT was set to 10 meters away from the receiving antenna which were mounted on an antenna tower. The antenna could be moved up and down between 1 meter and 4 meters to find out the maximum emission level. Broadband antenna was used as a receiving antenna. Both horizontal and vertical polarization of the antenna were set on measurement. In order to find the maximum emission, all of the interface cables were manipulated according to EN 55022 Class B requirements.

The bandwidth of the R & S Test Receiver ESCI was set at 120 kHz.

The frequency range from 30MHz to 1000MHz was pre-scanned with Peak detector and all the final readings of measurement were with Quasi-Peak detector.

5.5.2. For Frequency Range above 1GHz, which measurement was at Semi-Anechoic Chamber:

The EUT and its simulators were placed on a turn table which was 0.8 meter above ground. The portion of the test volume that was obstructed by absorber placed on the floor (30cm maximum). The turn table rotated 360 degrees to determine the position of the maximum emission level. EUT was set to 3 meters away from the receiving antenna which was mounted on an antenna tower. The antenna could be moved up and down between 1 to 4 meters to find out the maximum emission level. A calibrated Horn Antenna was used as a receiving antenna.

Both horizontal and vertical polarization of the antenna were set on measurement, and both average and peak emission level were recorded from spectrum analyzer. In order to find the maximum emission level, all the interface cables were manipulated according to EN 55022 on radiated measurement.

The resolution bandwidth of Agilent Spectrum Analyzer N9010A-526 was set at 1MHz.

The frequency range above 1GHz was checked and all final readings of measurement were with Peak and Average detector.

In chapter 7.6.6.1 the standard EN 55016-2-3:2010 requires to include the values of w in the test report:

“ w ”: The dimension of the line tangent to the EUT formed by θ_{3dB} at the measurement distance d . Equation shall be used to calculate w for each actual antenna and measurement distance used. The values of w shall be included in the test report. This calculation may be based on the manufacturer-provided receive-antenna beamwidth specifications:

$$w = 2 \times d \times \tan (0,5 \times \theta_{3dB})$$

Frequency GHz	3115 Horn	
	d = 3m	
	$\theta_{3Db} \text{ (min)}$ (°)	$w \text{ (min)}$ (m)
1.00	66	3.90
2.00	54	2.42
4.00	50	2.07
6.00	34	1.83

The values of w . are greater than chapter 7.6.6.1 of Table 3, the minimum dimension of w . (w_{min}) requirements.

5.6. Radiated Disturbance Measurement Results

PASSED. All emissions not reported are below too low against the prescribed limits.

7.5. Operating Condition of EUT

Same as conducted disturbance measurement which is listed in 4.4 except the test set up replaced by section 7.2.

7.6. Test Procedure

7.6.1. Air Discharge :

This test is done on a non-conductive surfaces. The round discharge tip of the discharge electrode shall be approached as fast as possible to touch the EUT. After each discharge, the ESD generator discharge electrode shall be removed from the EUT. The generator is then retrigged for a new single discharge and repeated 10 discharges each at positive and negative polarity for each preselected test point. This procedure shall be repeated until all the air discharge completed.

7.6.2. Contact Discharge :

All the procedure shall be same as 7.6.1. except that the tip of the discharge electrode shall touch the EUT conductive surfaces & repeated 25 discharges each at positive and negative polarity for each test point before the discharge switch is operated.

7.6.3. Indirect discharge for horizontal coupling plane

At least 25 discharges each at positive and negative polarity shall be applied to the horizontal coupling plane, at points on each side of the EUT. The ESD generator positions vertically at a distance of 0.1m from the EUT and with the discharge electrode touching the coupling plane.

7.6.4. Indirect discharge for vertical coupling plane

At least 25 discharges each at positive and negative polarity shall be applied to the center of one vertical edge of the coupling plane. The coupling plane, of dimensions 0.5m X 0.5m, is placed parallel to, and positioned at a distance of 0.1m from the EUT. Discharges shall be applied to the coupling plane, with this plane in sufficient different positions that the four faces of the EUT are completely illuminated.

7.6.5. For above tests, the voltage was increased from the minimum to the selected test level.

8.6. Test Procedure

The field sensor is placed on the EUT table (0.8 meter above the ground) which is 3 meters away from the transmitting antenna. Through the signal generator, power amplifier and transmitting antenna to produce a uniformity field strength (3V/m measured by field sensor) around the EUT table from frequency range 80 - 1000 MHz and records the signal generator's output level at the same time for whole measured frequency range. Then, put EUT and its simulators on the EUT turn table and keep them 3 meters away from the transmitting antenna which is mounted on an antenna tower and fixes at 1.55 meter (for 80 - 1000MHz) height above the ground. Using the recorded signal generator's output level to measure the EUT from frequency range 80 - 1000 MHz and both horizontal & vertical polarization of antenna must be set and measured. Each of the four sides of EUT must be faced this transmitting antenna and measures individually.

A CCD camera was put inside the chamber and through its display to monitor the EUT operational situation to judge the EUT Compliance criterion during measurement.

All the scanning conditions are as follows :

Condition of Test	Remarks
1. Field Strength	3 V/m (r.m.s, Unmodulated, Severity Level 2)
2. Amplitude Modulated	1kHz, 80%AM

9.4.2. Performance criterion : **B**

9.5. Operating Condition of EUT

Same as conducted disturbance measurement which is listed in 4.4 except the test set up replaced by section 9.2.

9.6. Test Procedure

The EUT and its simulators and all cables were placed 0.1m high above the ground reference plane which was a min. 1m*1m metallic sheet with 0.65mm minimum thickness. This reference ground plane shall project beyond the EUT by at least 0.1m on all sides and the minimum distance between EUT and all other conductive structure, except the ground plane beneath the EUT, shall be more than 0.5m.

9.6.1. For input and output AC power ports :

The EUT was connected to the power mains by using a coupling device which couples the EFT interference signal to AC power lines, and the length of the power line between the coupling device and the EUT shall be 0.5m or less . Both polarities of the test voltage should be applied during compliance test and the duration of the test can't less than 1min.

9.6.2. For signal lines and control lines ports :

The interface cables' length is less than 3m, therefore, it's unnecessary to measure.

9.6.3. For DC input and DC output power ports :

No DC ports. It's unnecessary to measure.

13.VOLTAGE DIPS AND INTERRUPTIONS IMMUNITY TEST

13.1.Test Equipment

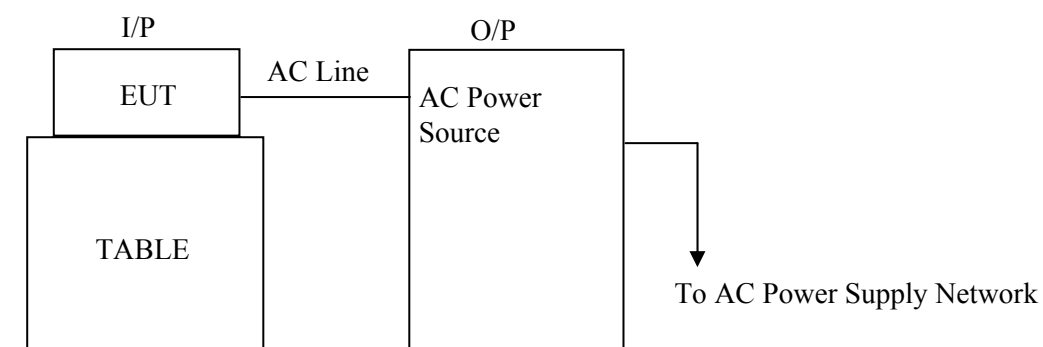

Item	Type	Manufacturer	Model No.	Serial No.	Cal. Date	Cal. Interval
1.	Programmable Power Source	TESEQ	NSG1007	1248A04038	2014. 01. 17	2 Years

13.2.Block Diagram of Test Setup

13.2.1. Block Diagram of connection between EUT and simulators.

Same as Section 8.2.1.

13.2.2. Test Setup

13.3.Test Standard

EN 55024:2010

【IEC 61000-4-11:2004,

Severity Level : Voltage interruptions : >95% reduction , 250 period ;

Voltage dips : >95% reduction, 0.5 period ; 30% reduction, 25 period.】

13.4. Severity Levels and Performance Criterion

13.4.1. Preferred severity levels and durations for voltage dips

Class ^a	Test level and durations for voltage dips (t_s) (50Hz/60Hz)				
Class 1	Case-by-case according to the equipment requirements				
Class 2	0% during ½ cycle	0% during 1 cycle	70% during 25/30 ^c cycles		
Class 3	0% during ½ cycle	0% during 1 cycle	40% during 10/12 ^c cycles	70% during 25/30 ^c cycles	80% during 250/300 ^c cycles
Class X ^b	X	X	X	X	X
^a Classes as per IEC 61000-2-4. ^b To be defined by product committee. For equipment connected directly or indirectly to the public network, the levels must not be less severe than Class 2. ^c “25/30 cycles” means “25 cycles for 50Hz test” and “30 cycles for 60Hz test”.					

13.4.2. Preferred severity levels and durations for short interruptions

Class ^a	Test level and durations for short interruptions (t_s) (50Hz/60Hz)
Class 1	Case-by-case according to the equipment requirements
Class 2	0% during 250/300 ^c cycles
Class 3	80% during 250/300 ^c cycles
Class X ^b	X
^a Classes as per IEC 61000-2-4.	
^b To be defined by product committee. For equipment connected directly or indirectly to the public network, the levels must not be less severe than Class 2.	
^c “250/300 cycles” means “250 cycles for 50Hz test” and “300 cycles for 60Hz test”.	

13.4.3. Performance criterion :

- 1) Voltage dips >95% reduction performance criterion **B**.
- 2) Voltage dips 30% reduction performance criterion **C**.
- 3) Voltage interruption >95% reduction performance criterion **C**.

13.5. Operating Condition of EUT

Same as conducted disturbance measurement which is listed in 4.4 except the test set up replaced by section 13.2.

13.6. Test Procedure

- 13.6.1. Set up the EUT and test generator as shown on section 13.2.
- 13.6.2. The interruption was introduced at selected phase angles with specified duration. There was a 10s minimum interval between each test event.
- 13.6.3. After each test a full functional check was performed before the next test.
- 13.6.4. Repeat procedures 13.6.2. & 13.6.3. for voltage dips, only the test level and duration was changed.
- 13.6.5. Record any degradation of performance.

13.7. Test Results

PASSED. (Complied with Criterion B in Voltage Interruption & Criterion A in Voltage Dips).

The EUT with the following test mode was measured during this section testing and all the test results are listed in next page.

The details of test modes are as follows :

Mode	Input Port	Display, Resolution/Frequency
1	DVI	“H” Pattern, 1920*1080/60Hz
